

## Term Project Design

### 1. Web Site Description

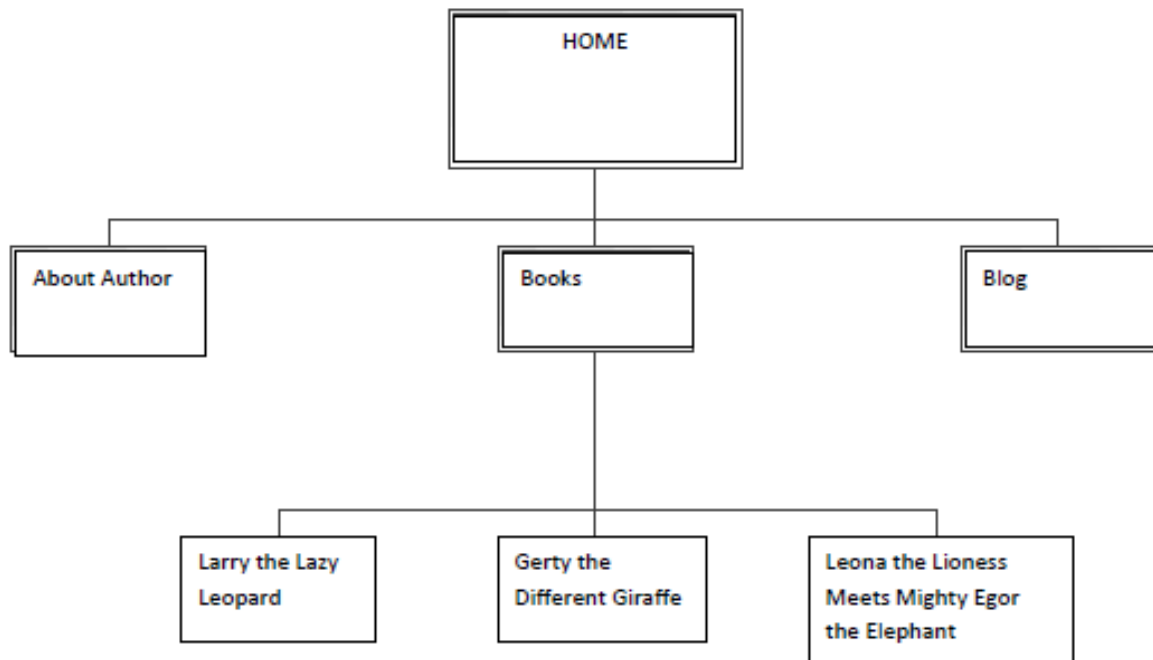

This web site is for the client's home business. The client writes and illustrates children's books, and self-markets her books via stickers, magnets, book marks, word of mouth, and through a blog. The web site's objective is to serve as a complement to the client's self-marketing in order to give her and her books more visibility. This web site will also provide information about what her books are about and where they are available for purchase.

### 2. HTML5 and CSS Techniques

#### a. Subfolder Organization

**b. Site Map**

The web pages of the site will all have a two-column layout using CSS, as demonstrated in the wireframe design in the following section. There will be an external CSS style sheet called “mariastyle.css” (in the styles folder) which will be applied to all web pages of the site. Navigation will be located on the left column as simulated icon buttons using CSS. The web site will include an “About Author” page with pertinent information about the author, her contact information (e-mail) and the contact information of the web designer for troubleshooting. All pages will feature internal navigation through fragment id’s to include a “Go to Top of the Page” link. The books page will contain pictures of the covers of each book along with their respective titles and a link to the specific book’s page arranged in an HTML table.

HTML5 techniques to be used will include lists, tables, headers, div elements, span elements, hyperlinks, and the image element, among others. CSS3 tools to be used will include class and id selectors, pseudo-classes for hyperlinks and navigation buttons, relative positioning, and properties such as background-color, color, margin, float, and padding.

### 3. Wireframe Design
